Learning Events (SEA)

• For *individual and practice learning*
• Highlight areas for development *as Individual and Practice*
• Identify gaps/weaknesses *in systems*
• Stimulate discussion and *reflection as a group*
• Consider *particular types of presentation e.g emergency*
The role of primary care in cancer diagnosis via emergency presentation: qualitative synthesis of significant event reports

E D Mitchell, G Rubin, L Merriman and U Macleod

Research

Elizabeth D Mitchell, Greg Rubin and Una Macleod

Understanding diagnosis of lung cancer in primary care: qualitative synthesis of significant event audit reports
## Significant Event Audit of Cancer Diagnosis

### Cancer SEA Report Template

| Diagnosis: |  |
| Date of diagnosis: |  |
| Age of patient at diagnosis: |  |
| Sex of patient: |  |
| Is the patient currently alive (Y/N): |  |
| If deceased, please give date of death: |  |
| Date of meeting where SEA discussed: |  |

N.B.: Please DO NOT include the patient’s name in any narrative

### 1. What Happened?

Describe the process to diagnosis for this patient in detail, including dates of consultations, referral and diagnosis. Consider for instance:

- The initial presentation and presenting symptoms (including where it originated from care).
- The key consultation at which the diagnosis was made.
- Consultations in the year prior to diagnosis and referral (how often the patient had been seen by the practice and for what reasons).
- Whether she/him had been seen by the Out of Hours service, A&E, or in secondary care clinics.
- If there appears to be delay on the part of the patient in presenting with their symptoms.
Early Diagnosis of Cancer Significant Event Analysis Toolkit

Cancer SEAs prompt a GP to reflect on their diagnosis, and identify any potential improvements in practice systems using documentation or proactive safety netting. At CCG or Health Body level, a cancer or quality improvement lead may find emerging themes and use local intelligence to address and manage issues. Cancer Significant Event Analysis (SEA) can support dialogue between the primary and secondary care interface and have benefits for clinicians, practices and patients.

Who is the toolkit for?
This cancer SEA toolkit and its resources support GPs, practice staff and commissioners in conducting high quality cancer SEAs with the aim of improving patient outcomes in the early diagnosis of cancer.
This toolkit may be used by CCG/Health Body or cancer leads, practice OP leads or any GP in practice delivering training and includes guidance for quality improvement across the primary secondary care interface.
If you are based in Wales or Scotland and interested in your practice taking part in the National Cancer Diagnosis Audit, please find out more and register here. Note that the audit in England has now closed.

- Training resources for cancer/commissioning leads
- Examples of SEAs with thematic analysis
- Resources and guidance for training practice staff
- Safety netting in primary care
- Additional cancer risk assessment tools
- Background and rationale
Training resources for cancer/commissioning leads

Examples of SEAs with thematic analysis

Resources and guidance for training practice staff

The Cancer SEA GP guide can be used by any GP wishing to undertake a Cancer SEA. The guide can also be issued as a 'hand-out' for GPs in your training events.

'Early Diagnosis of Cancer - Quality Improvement Using Cancer Significant Event Analysis' training session resources

The following resources consist of a presentation that can be adapted for your training events, and resources to support this:

► Cancer SEA training slides with trainer notes
► Cancer SEA session - lesson plan
► Example cancer SEA session agenda

Resources for training sessions:

► Cancer SEA Template (2016)
► Instrument feedback tool
► Workshop brief
► Example SEA – Patient A handout
► Example SEA – Patient B handout
► Example SEA – Patient C handout
► Example evaluation form

Safety netting in primary care

Pancreatic Cancer

Overview

In this section you can find out about the experience of pancreatic cancer by seeing and hearing people share their personal stories on film. Our researchers travelled all around the UK to talk to 40 people (including 8 people who cared for a relative who died from the cancer) in their own homes. Find out what people said about issues such as symptoms, treatment, potentially curative surgery and impact on family. We hope you find the information helpful and reassuring.

You can start viewing topics by clicking 'Next Topic' above, or selecting from the list on the left. You can also view 'People's Profiles' from the tab above.

Patient
GatewayC is an online cancer education platform developed for GPs, practice nurses and other primary care professionals. The platform aims to improve cancer outcomes by facilitating earlier and faster diagnosis and improving patient experience, through:

- Improved knowledge of symptoms
- Increased confidence in when and when not to refer a patient
- Improved quality of suspected cancer referrals, reducing delays in the system
- Improved communication to enhance the patient experience and support patients at each stage of their cancer journey.

GatewayC has been developed by GPs, specialists and patients. Courses are endorsed by Cancer Research UK and accredited by the Royal College of General Practitioners.
Every year in the UK over 300,000,000 GP consultations take place.
The original tool is based on two risk calculators for cancer; the Risk Assessment Tool (RAT) algorithm developed by Professor Willie Hamilton and the QCancer® algorithm developed by Professor Julia Hippsley-Cox.

Currently:

- Integrated QCancer tool is available for EMIS Web users in England, Wales and NI.
- Integrated CDS tool is available for INPS Vision users across the UK.
- Still working with TPP SystmOne.
Q Cancer

Prompts

For each patient with a cancer risk above 2%, a prompt appears with the patient’s QCancer score and the reasoning behind it.

Uses patient record, relevant tests and read-coded symptomatic information from the previous 12 months.

Useful if a patient has presented with vague symptoms and/or has seen a number of GPs.
Q Cancer Symptoms and Follow Up

Symptom Check List

The following check list is not exhaustive

Q Cancer uses a current symptoms algorithm

Pre-existing information from the medical record

Does the patient currently have.... (brackets denote calculation):

- Appetite loss (1m)
- Abnormal or Unexplained weight loss (1m)
- Abdominal pain (1m)
- Abdominal swelling (1m)
- Difficulty swallowing liquids (1m)
- Difficulty in swallowing solids (1m)
- Indigestion (1m)
- Heartburn (1m)
- Cough (12m)
- Change in bowel habit (12m)
- Constipation (12m)
- Painless rectal bleeding (1m)
- Painful rectal bleeding (1m)
- Blood in vomit (1m)
- Blood in sputum (1m)
- Blood in urine (1m)

NICE suspected cancer referral guidelines

Updated National Institute of Health and Care Excellence (NICE) referral guidelines for suspected cancer were published on 23rd June 2015, replacing the 2005 version.
This resource summarises NICE's 2015 referral guidelines for suspected cancer (NG12).
The information in this summary is correct to the best of our knowledge but does not replace clinical judgement.
The full guidelines can be found here: https://www.nice.org.uk/guidance/ng12
If you have any feedback or want more information please contact earlydiagnosis@cancer.org.uk or visit our webpage http://bit.ly/1QIV6U0

Please note, pathways may differ due to local variation in commissioned services.

**KEY**
- A: Abnormal
- 2w: 2 week wait
- 45+: 45 and over etc
- BCC: Basal cell carcinoma
- EUS: Endoscopic ultrasound
- IDA: Iron deficiency anaemia
- DVT: Deep vein thrombosis
- ESR: Erythrocyte sedimentation rate
- IDUS: Intravenous digital subtraction angiography
- LUTS: Lower urinary tract symptoms
- NAV: Nausea/vomiting
- OCD: Upper Gt endoscopy
- PSA: Prostate specific antigen
- SCC: Squamous cell carcinoma
- SE: Shortness of breath
- US: Ultrasound scan
- WBC: White blood cell
Improve your knowledge of the **prevention** and **detection** of oral cancer, including what to look out for and when and how to respond. This toolkit covers oral and oropharyngeal cancers including lip cancer.

**Referral decision guide**

This practical tool illustrates the red flags which should prompt referral to secondary care via a suspected cancer pathway.

- View referral decision guide

**Patient case studies**

To learn more about diagnosing and referring oral cancer, read case studies from Richard Shaw, Professor of Head and Neck Surgery, University of Liverpool and Aintree University Hospital NHS Trust.

- View patient case studies

**Oral cancer risk factors**

Some of the risk factors associated with oral cancer include:

- Age
- Tobacco use (smoking and chewing)
- Betel quid (areca nut) use
- Alcohol consumption
- Human papillomavirus infection
- Low fruit and vegetable consumption

**Test your knowledge**

Boost your knowledge of oral cancer and contribute to your CPD with this quiz-based module.

- Take the quiz

**Lesion recognition resource**

Top 2-week wait referrals

Here is a list of some of the most common referrals under the 2-week wait rule that are subsequently confirmed not to be melanoma. It may be helpful to consider these options when presented with a suspect lesion:

- Benign melanocytic naevi
- Seborrhoeic keratoses
- Dermatofibroma
- Angioma
- Basal cell carcinoma
- Squamous cell carcinoma, Bowen’s disease and solar keratosis
- Solar lentigo
- Lichenoid keratoses
- Viral warts
- Pyogenic granuloma

Top tips

A systematic approach to lesion recognition in primary care.

Differential diagnosis

Seborrhoeic keratosis

Seborrhoeic keratoses (otherwise known as seborrhoeic warts or basal cell papillomas) are benign proliferations of epidermis. They are present in nearly all people over the age of 50 years and many younger adults too. They have no malignant potential. The only issue is in distinguishing them from skin cancers and although most are easily diagnosed, some melanomas actually induce "wartiness" of the overlying epidermis and may mimic seborrhoeic keratoses.

These lesions may look "stuck on" and "greasy". Most often they are coffee coloured but can be very variable in colour from pail grey or yellow to brown or black. There is usually a rough or fissured surface. Milia like cysts may be visible to the naked eye and especially with the dermatoscope. However, such cysts may also be seen in melanomas. It is quite common for parts of the seborrhoeic keratoses to fall off and they are relatively easily picked off. They may be itchy or irritating.

Browse images and descriptions of different types of lesion and view referral guidelines.

› Early Diagnosis of Cancer
Early Diagnosis of Cancer

This course highlights the importance of recognising cancer in its early stages and the essential role of the GP in identifying common delays. It includes reflective cases, risk toolkits and practical suggestions on how to improve your practice and helps you to discover ways to diagnose cancer earlier.

This course was developed in partnership with Cancer Research UK.

This course is FREE to all healthcare professionals in the UK.

Time to complete this course:
30 minutes

Date of publication:
November 2012

Reviewed and updated:
October 2018

e-certificate for Early Diagnosis of Cancer

When you have completed the activities a link to your eCertificate will appear above.

Learning Sessions

Work your way through the course by clicking on the links below.
Welcome to the Cancer Education Hub

There are five key areas where GPs are involved in cancer care. These form a 'patient journey', although not all steps will be relevant for individual patients.

Resources
- Improving diagnosis of cancer - a toolkit for General Practice
- National Cancer Diagnosis Audit Tool

Continual Professional Development (CPD)

Keep up to date in this fast changing clinical area with accredited educational resources designed to test your knowledge and support the early diagnosis of cancer.

These resources have been developed or compiled by Cancer Research UK in partnership with relevant clinical experts and organisations including Doctors.net.uk, RCGP, BMJ and the Department of Health. Most of the resources are open access, some are located on the other organisations’ websites, and some might require a login.

Primary Care Cancer Toolkit
A collection of key evidence-based resources about cancer prevention, diagnosis and care relevant for the primary care setting from CRUK and RCGP. Open access to all health professionals.

Patient
Safety netting is an important tool that can be used to support management of diagnostic uncertainty, helping ensure patients are re-evaluated in a timely and appropriate manner.

What is safety netting?

Evidence for safety netting in diagnosing cancer

Safety netting recommendations and resources
Safety Netting

EMIS WEB GUIDE

Delivered in collaboration with the NW London Primary Care Cancer Board, this pilot has been developed for all members of the practice team including clinicians and administrators to improve confidence to implement safety netting systems in your practice using EmisWeb in ways that are already familiar.

Screening for cancer

Cancer screening involves testing apparently healthy people for signs of the disease. It can save lives by finding cancers at an early stage, or even preventing them. Screening is not the same as the tests a person may have when doctors are diagnosing or treating cancer.

Are you eligible for screening?

- Female
- Male

Age:

Where do you live?

- England
- Wales
- N. Ireland
- Scotland

The UK has 3 screening programmes

- Bowel cancer screening
- Breast cancer screening
- Cervical cancer screening

Benefits and risk of screening

We know that cancer screening saves thousands of lives each year. It can detect cancers at an early stage and in some cases, even prevent cancers from developing in the first place.

But screening is not perfect. The tests can miss cancers, and have other risks too.

Your choice

Whether or not to go for screening is your choice. You should read the information you are sent with your screening invitation to help you make an informed decision, and ask your doctor if you need help.

Find out more about screening
Bowel screening resources

Here you can find resources and examples of good practice that can support you to plan and deliver improvement activity at a local level.

A growing evidence base has highlighted a number of interventions that increase uptake of bowel screening, which is currently low, while promoting informed consent.

To let us know if you are aware of or are involved in projects that could provide further evidence of good practice in order to support local teams, please email us on bowel-screening@cancer.org.uk.

- GP endorsement letters
- Bowel screening leaflets

How we can help

We pull together resources and information that can help you increase uptake of bowel screening in your area while promoting informed consent.

Introduction of the Faecal Immunochemical Test (FIT)

Bowel cancer screening reduces bowel cancer mortality. Since bowel cancer screening began in the UK, it has made use of a certain type of faecal occult blood test - a guaiac-based test (gFOBT). Now, the guaiac test is being replaced by a Faecal immunochemical Test (FIT) test.

Here you can find information on the new test, its implementation and how this will affect healthcare professionals, people invited for screening, and patients.

What is FIT?

FIT in screening

Why is FIT replacing gFOBT in the bowel screening programme?

Reporting of FIT screening results to health service providers

About this data
The data used is from a range of publicly available sources or directly from the health system or the government. Data sets have different availabilities and breakdowns and are not always comparable.

› See more guidance about local data

National cancer statistics
Get the latest cancer statistics including key stats, in-depth explanations and raw data on cancer incidence, mortality, survival, risk, and diagnosis and treatment.

NATIONAL CANCER DIAGNOSIS AUDIT
HELPING YOU REVIEW PRACTICE PROCESSES AND IMPROVE CANCER OUTCOMES

WHAT IS THE AUDIT ABOUT?
The National Cancer Diagnosis Audit (NCDA) looks at patient pathways from first presentation to cancer diagnosis to:
- provide urgent needed data on the contribution of primary care to cancer diagnoses, which are not available nationally from any other source
- better understand the use of primary care-led investigations and referral pathways
- inform delivery of best care for cancer patients
Repeated rounds of the audit allow monitoring of the impact of changes at practice level, and ongoing reflection and quality improvement.

WHY SHOULD YOU TAKE PART?
- Improve cancer care and outcomes for your patients
- Understand how your practice compares to other services
- Highlight and evidence good practice
- Identify diagnostic challenges
- Demonstrate quality improvement for GP appraisal, re-validation and CCG inspection

WHAT WE'VE LEARNED SO FAR
- Burden of co-morbidities is high with 75% of cancer patients suffering from at least one co-morbidity and nearly half (46%) suffering from multiple co-morbidities
- GPs refer promptly (79% of patients referred to a specialist after fewer than three consultations)
- Half of patients diagnosed as emergencies (41%) had seen their GP in the same episode of illness, but nearly half (46%) had not
- GPs felt that one in five patients (22%) had experienced an avoidable delay on their pathway
- Many practices undertook quality improvement activities, often focusing on referral behaviours, safety netting or screening uptake

I found the whole process incredibly easy and very informative... it is definitely worth doing and I am planning to do (it) again next year.
GP from Doncaster

PLANS FOR 2019 NCDA (ENGLAND)

Online registration for the next NCDA will open from February 2019
Data collection in England due to start from April 2019

How it works:

• GPs register online and will be given a secure account and password for the online NCDA portal which is linked to their practice.

• From April 2019 patients newly diagnosed with cancer registered at their practice will automatically appear on the portal once they are logged on the Cancer Registry; GPs will get a monthly email to alert them to new cases.

• For each patient GPs then submit data on key dates, symptoms, number of consultations, types of investigations, referral(s) and patient characteristics.

• Patients with certain characteristics will automatically be flagged by the system for further review / as a learning event (e.g. emergency diagnosis, those who died within 30 days of diagnosis etc.)

• Analyse the data and create tailored practice reports which will be shared via the online portal.

• Support from CRUK facilitators & Macmillan GPs, and resources from CRUK and the RCGP, are available to support discussion of audit findings and planning of quality improvement activity.
Tailored help for GP practices

Support for quality improvement in your practice.

Facilitator visits
Our facilitators work directly with the NHS to drive improvement in cancer prevention and diagnosis.

More about what we do

Where are the facilitators
Our regional teams of facilitators work across England, Scotland and Wales, and will soon arrive in Northern Ireland.

Find a Facilitator near you

Training by Facilitators
Facilitators deliver training across all cancer priority areas, particularly: safety netting and urgent referral guidance.

See more on training

"CRUK Facilitators have played a significant role in introducing and embedding improvement in cancer screening and referral."

• Behind the headlines
Media claims of breast cancer testing tool are premature

Tuesday January 15 2019

The UK media has reported on a “game changing” breast cancer gene test. The Times made the bold statement that “Women will be told their exact lifetime risk of getting breast cancer ... allowing some to take drugs to prevent the disease”. The Mail Online said that “GPs will use an online tool to predict women's risk”.

The media headlines are premature. We are not at the point where all women are about to be invited for a breast cancer gene test.

The new study reports the development of a breast cancer risk prediction model called the Breast and Ovarian Analysis of Disease Incidence and Carrier Estimation Algorithm or BOADICEA for short. The model is a highly complex equation that takes into account risk factors for breast cancer such as obesity and alcohol intake, plus genetic data and mammography findings.

We're a long way from knowing if such a tool is ever likely to be brought into clinical practice. There would be many things to consider such as who you'd offer the test to and when, the practicality of getting all the required data, and the accuracy of the predictions.

There is also the issue that being told you have an increased risk of breast cancer could cause considerable psychological distress. It could also lead some women to take medication needlessly when they may never have gone on to develop breast cancer.
