TESTING TIMES TO COME?
AN EVALUATION OF PATHOLOGY CAPACITY IN NORTHERN IRELAND

NOVEMBER 2016
EXECUTIVE SUMMARY

Whilst cancer survival is at its highest ever level, our health services are under considerable pressure. Increasing cancer incidence, an ageing population and efforts to improve outcomes means that the demand for cancer diagnostics has never been higher.

The number of cancer cases diagnosed each year in Northern Ireland (NI) is rising. There were around 352,000 new cancer diagnoses in the UK in 2013\(^1\) and this is set to increase considerably as we live longer. Indeed, around half of us will be diagnosed with cancer in our lifetime.\(^2\)

The 62-day cancer waiting times has not been achieved across NI since it was introduced in 2009. Since the first quarter of 2013, national performance has deteriorated. In the first quarter of 2016 only 69.9% of patients began treatment within 62 days.

Our previous research showed that endoscopy and imaging services have been delivering more activity over recent years\(^3\),\(^4\) but they are currently struggling to meet demand – leading to a diagnostic bottleneck and thousands of patients waiting in limbo.

Ensuring diagnostic services can cope with future demand is essential if we are to improve outcomes for patients through early diagnosis.

Pathology has a major role in the diagnosis and treatment of cancer, as well as many other conditions. Pathology is comprised of 19 different disciplines and our research focussed on the most relevant to cancer: cellular pathology (which encompasses both histopathology and cytopathology); blood sciences; and molecular pathology.

Cancer Research UK commissioned this research\(^1\) to understand the pressures facing pathology services across the UK and to identify solutions to address these issues.

CURRENT LANDSCAPE

Increased demand on pathology services is due to higher cancer incidence, the growing complexity of referrals and requests, and the introduction of initiatives to increase earlier cancer diagnosis.

Cellular pathology, blood sciences and molecular pathology have all experienced an increase in activity in recent years. Each specialty is also experiencing difficulties in staffing their services to different extents.

Based on the number of pathologists currently in training and the age profile of the current workforce, our study found there is likely to be a severe crisis in pathology capacity within the next five to ten years.

CELLULAR PATHOLOGY

Year on year, the amount of histopathology requests received by each laboratory has been going up by around 4.5% on average.\(^5\) Demand has also increased as requests are increasing in complexity.

However, capacity has not kept up: staffing levels have not increased at the same rate as

---

\(^1\) Conducted by 2020 Delivery.
demand. Staffing estimates suggest that consultant cellular pathologist numbers have increased, but only by 3% per year.

In the next five to ten years there will be a shortage of consultant pathologists across all areas of pathology. This will have the largest impact on cellular pathology, as there is a shortfall in the numbers becoming cellular pathology consultants compared to those leaving the profession.

Many organisations have reported staffing shortages. To tackle the difficulty at recruiting at consultant level, there has been some use of skill mix approaches and role expansion, but implementation is varied. Many cellular pathologists have been reducing their other commitments such as training and research.

Waiting times in cellular pathology are now starting to increase as a result of the increasing mismatch between staffing capacity and demand.

**BLOOD SCIENCES**

There has also been an increase in blood sciences activity. However, some processes in blood sciences have been automated, which has meant that the increase in demand has been absorbed by technological developments.

Delivery of blood sciences has changed, as the ratio of medical laboratory assistants to biomedical scientists increase – from 0.34 in 2008/9 to 0.51 in 2014/5. Vacancies are a problem for blood sciences but not to the same extent as cellular pathology.

**MOLECULAR PATHOLOGY**

Demand for molecular testing has increased: between 2012 and 2014, testing activity in NI increased by 20% for lung cancer, colorectal cancer and melanoma collectively. However fewer tests were being requested than would be expected from patient eligibility. In Northern Ireland in 2014 around 570 molecular diagnostic tests were not undertaken, based on estimated demand and there are still difficulties in gaining access to the relevant targeted treatment following tests.

**RECOMMENDATIONS**

Without action taken now to address workforce issues and improve efficiency, waiting times are likely to increase as it will take longer to process and report all requests. This means more people will be left in limbo when they require tests, and it may delay patients’ diagnosis and treatment.

Turnaround times will increase to unacceptable levels which could compromise efforts to diagnose cancer earlier. Immediate action is needed to avert a crisis in pathology capacity and ensure we have a service that is fit for the future.

**ENSURE PATHOLOGY SERVICES ARE MAXIMISING EFFICIENCY**

There are inefficiencies in pathology services that must be reduced. Networking and consolidation of pathology services should continue.

Haematology and biochemistry should continue to increase productivity – absorbing the increase in workload through enhanced utilisation of equipment capacity. Long term plans for staff, equipment and consumables should be made to address growing demand. Time for giving more clinical advice should acknowledge increasing complexity of tests.

Reducing pathology with limited clinical value (e.g. duplicative tests, or those which are not clinically recommended) could potentially reduce demand. This should be thoughtfully used as there is a risk it could undermine efforts to improve earlier diagnosis (and associated increase in referrals). However, reducing unwarranted demand has been recognised through the ‘Choosing Wisely’ efforts, and could be addressed through creating an Atlas of Variation, as well as the Royal College of
Pathologists’ ‘Minimum Retesting Intervals Guidance in Pathology’.

**OPTIMISE THE PATHOLOGY WORKFORCE**

Delivery of pathology services is currently getting more expensive due to increasing costs for staff overtime and outsourcing. To tackle this, pathology needs to utilise ‘skills mix’ approaches, where health professionals working within a service take on different but complementary roles and activities. However, efficiency and skills mix approaches will only go so far. In the long term, increasing demand means that we will need more pathologists and scientists.

The Northern Ireland Medical and Dental Training Agency may need to explore increasing the provision of training places for pathology, depending on their ongoing review of the cancer workforce. Pathology may need to be included on the curricula in medical schools where pathology is not currently offered.

Another way to boost supply of the pathology workforce is to keep people within the profession for longer. To retain near-retirement consultants, HSC Trusts should encourage them to remain at the organisation, for example by implementing flexible working and home reporting. The Department of Health should give individual organisations flexibility in order to decide the terms that they arrange with individuals.

**RECOMMENDATION 1:** Health and Social Care Trusts and their pathology departments, supported through guidance from professional bodies and the Department of Health, should:

a) Ensure biomedical scientists (BMS) are being utilised to cut up specimens where possible, in accordance with ‘Principles of Good Practice for Biomedical Scientists Involved in Histopathological Dissection’.

b) Explore the role of clinical scientists to support complex diagnostics and research. Clinical scientist input should be recognised in their job plans with backfill provided for existing duties.

c) Develop graduated increase in trainee responsibility and supervised reporting in accordance with the Royal College of Pathologists guidance on graded responsibility. The Royal College of Pathologists should update and promote their guidance document.

d) Ensure widespread use of biomedical scientist reporting following their completion of the Biomedical Scientist reporting programme.

**RECOMMENDATION 2:** The Royal College of Pathologists should continue to run programmes aiming to attract more staff to cellular pathology. Pathology numbers should feature in the annual workforce planning unit reviews.

**RECOMMENDATION 3:** The Department of Health should ensure there is flexibility and the impact of contract negotiations on near-retirement consultants.

**FUTURE-PROOF PATHOLOGY**

As more pathologists are struggling to meet clinical obligations, many are deprioritising other activities like teaching and research. Without pathologists getting involved, academic input will decline and innovation in treatments and care may make slower progress.

Technology is changing, presenting new opportunities to improve pathology, including ‘digital pathology’.

Another area of innovation is molecular pathology. The level of provision of molecular diagnostic tests has recently been audited by NHS England to understand if there are areas where patients are not
receiving the level of testing that would be expected. This should continue. Standardisation of testing could be achieved through the National Laboratory Medicines Catalogue, which is intended to act as the professional reference for all pathology tests approved for use in the UK.

**RECOMMENDATION 5:** There should be continued support from researchers, funders and professional bodies for the CM-Path initiative\(^2\) and delivery of the four work streams within its strategy. Workforce initiatives should allow pathologists to spend time on research. The recommendations from ‘Every Patient a Research Patient’\(^{xiii}\) should also be implemented to encourage a more positive research environment in the health service, including investment in academic pathology training posts and chairs.

**RECOMMENDATION 6:** Departments and Trusts should invest in infrastructure to support digital pathology and businesses/researchers should look at how to make this worthwhile. Sharing results and on-screen examination of histological slides should both be utilised in the short term to enable more efficient, networked services. Electronic requests should also be used.

**RECOMMENDATION 7:** Molecular pathology should be more involved with the whole diagnostic process for solid tumours (including how molecular pathology results are reported), in a similar way to blood cancer. This should be facilitated through better IT connectivity and closer working between relevant staff groups.

**IMPROVE UNDERSTANDING OF PATHOLOGY PROVISION**

There is little pathology data currently collected at a national level, which makes understanding activity and capacity more difficult. There must be reliable data to enable effective planning and commissioning of services. This information should be made available for all to use: by government departments and health service organisations in workforce planning and by charities such as Cancer Research UK in understanding service challenges. The impact on pathology is also often overlooked when changes are made to service provision, such as the innovative diagnostic pathways.

**RECOMMENDATION 8:** HSC Trusts should invest in technology so departments can supply more comprehensive data to central collections. The Royal College of Pathologists should pro-actively collect comprehensive workforce information from departments across the UK.

**RECOMMENDATION 9:** The Department of Health should ensure all work on diagnostic pathways factors in the impact on pathology. Workforce and resourcing plans must ensure pathologists and clinical scientists are involved in the dialogue.

\(^2\) CM-Path aims to support academic cellular molecular pathology in the UK.
